UC Merced immunology labs study molecular and cellular processes of immune development, responses during infection, dysregulation during disease, and behavior of the pathogens eliciting these responses. We utilize a combination of standard immunological, molecular biology and biochemical techniques along with proteomics and computational approaches to probe immunological questions from multiple perspectives.

In addition to QSB and MCB seminars, the immunology researchers at UC Merced participate in weekly journal club presentations and an annual immunology retreat.

Graduate students are the core of our research program and we take your education seriously. Applications for graduate admissions are due December 15.
