◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Let L_1 be language recognized by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language recognized by $G_2 = (V_2, \Sigma_2, R_2, S_2)$ ls $L_1 \cup L_2$ a context free language?

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Let L_1 be language recognized by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language recognized by $G_2 = (V_2, \Sigma_2, R_2, S_2)$ Is $L_1 \cup L_2$ a context free language? Yes.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Let L_1 be language recognized by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language recognized by $G_2 = (V_2, \Sigma_2, R_2, S_2)$ Is $L_1 \cup L_2$ a context free language? Yes. Just add the rule $S \to S_1 | S_2$

Let L_1 be language recognized by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language recognized by $G_2 = (V_2, \Sigma_2, R_2, S_2)$ Is $L_1 \cup L_2$ a context free language? Yes. Just add the rule $S \rightarrow S_1 | S_2$ But make sure that $V_1 \cap V_2 = \emptyset$ (by renaming some variables).

Let L_1 be language recognized by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language recognized by $G_2 = (V_2, \Sigma_2, R_2, S_2)$ Is $L_1 \cup L_2$ a context free language? Yes. Just add the rule $S \rightarrow S_1 | S_2$ But make sure that $V_1 \cap V_2 = \emptyset$ (by renaming some variables).

Closure of CFLs under Union $G = (V, \Sigma, R, S)$ such that $L(G) = L(G_1) \cup L(G_2)$: $\blacktriangleright V = V_1 \cup V_2 \cup \{S\}$ (the three sets are disjoint)

$$\blacktriangleright \Sigma = \Sigma_1 \cup \Sigma_2$$

$$\blacktriangleright R = R_1 \cup R_2 \cup \{S \to S_1 | S_2\}$$

Proposition

CFLs are closed under concatenation and Kleene closure

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

Concatenation:

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

► Concatenation: L_1L_2 generated by a grammar with an additional rule $S \rightarrow S_1S_2$

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

- Concatenation: L_1L_2 generated by a grammar with an additional rule $S \rightarrow S_1S_2$
- Kleene Closure:

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

- ► Concatenation: L_1L_2 generated by a grammar with an additional rule $S \rightarrow S_1S_2$
- ► Kleene Closure: L_1^* generated by a grammar with an additional rule $S \rightarrow S_1 S | \epsilon$

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

- ► Concatenation: L_1L_2 generated by a grammar with an additional rule $S \rightarrow S_1S_2$
- ► Kleene Closure: L_1^* generated by a grammar with an additional rule $S \rightarrow S_1 S | \epsilon$

As before, ensure that $V_1 \cap V_2 = \emptyset$. *S* is a new start symbol.

Proposition

CFLs are closed under concatenation and Kleene closure

Proof.

Let L_1 be language generated by $G_1 = (V_1, \Sigma_1, R_1, S_1)$ and L_2 the language generated by $G_2 = (V_2, \Sigma_2, R_2, S_2)$

- ► Concatenation: L_1L_2 generated by a grammar with an additional rule $S \rightarrow S_1S_2$
- Kleene Closure: L_1^* generated by a grammar with an additional rule $S \rightarrow S_1 S | \epsilon$

As before, ensure that $V_1 \cap V_2 = \emptyset$. S is a new start symbol. (Exercise: Complete the Proof!)

Let L_1 and L_2 be context free languages.

Let L_1 and L_2 be context free languages. $L_1 \cap L_2$ is not necessarily context free!

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let L_1 and L_2 be context free languages. $L_1 \cap L_2$ is not necessarily context free!

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Proposition

CFLs are not closed under intersection

Let L_1 and L_2 be context free languages. $L_1 \cap L_2$ is not necessarily context free!

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

▶ The stack of P' is the stack of P

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- ► The stack of P' is the stack of P
- The state of P' at any time is the pair (state of P, state of M)

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- The stack of P' is the stack of P
- ► The state of P' at any time is the pair (state of P, state of M): Q_{P'} = Q_P × Q_M

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- The stack of P' is the stack of P
- ► The state of P' at any time is the pair (state of P, state of M): Q_{P'} = Q_P × Q_M

• These determine the transition function of P'.

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- The stack of P' is the stack of P
- ► The state of P' at any time is the pair (state of P, state of M): Q_{P'} = Q_P × Q_M
- These determine the transition function of P'.
- The final states of P' are those in which both the state of P and state of M are accepting:

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- The stack of P' is the stack of P
- ► The state of P' at any time is the pair (state of P, state of M): Q_{P'} = Q_P × Q_M
- These determine the transition function of P'.
- ► The final states of P' are those in which both the state of P and state of M are accepting: F_{P'} = F_P × F_M

Proposition

If L is a CFL and R is a regular language then $L \cap R$ is a CFL.

Proof.

Let *P* be the PDA that accepts *L*, and let *M* be the DFA that accepts *R*. A new PDA *P'* will simulate *P* and *M* simultaneously on the same input and accept if both accept. Then *P'* accepts $L \cap R$.

- The stack of P' is the stack of P
- ► The state of P' at any time is the pair (state of P, state of M): Q_{P'} = Q_P × Q_M
- These determine the transition function of P'.
- ► The final states of P' are those in which both the state of P and state of M are accepting: F_{P'} = F_P × F_M

Why does this construction not work for intersection of two CFLs?

Complementation

Let *L* be a context free language. Is \overline{L} context free?

• Both for-loops take O(n) time where n = |G|.

Determining generating symbols

```
Algorithm

Gen = {}

for every rule A \to x where x \in \Sigma^*

Gen = Gen \cup \{A\}

repeat

for every rule A \to \gamma

if all variables in \gamma are generating then

Gen = Gen \cup \{A\}

until Gen does not change
```

- Both for-loops take O(n) time where n = |G|.
- Each iteration of repeat-until loop discovers a new variable. So number of iterations is O(n). And total is O(n²).

Membership Problem

Given a CFG $G = (V, \Sigma, R, S)$ in Chomsky Normal Form, and a string $w \in \Sigma^*$, is $w \in L(G)$?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Membership Problem

Given a CFG $G = (V, \Sigma, R, S)$ in Chomsky Normal Form, and a string $w \in \Sigma^*$, is $w \in L(G)$? Central question in parsing.

Let |w| = n. Since G is in Chomsky Normal Form, w has a parse tree of size 2n − 1 iff w ∈ L(G)

(ロ)、(型)、(E)、(E)、 E) の(の)

- Let |w| = n. Since G is in Chomsky Normal Form, w has a parse tree of size 2n − 1 iff w ∈ L(G)
- Construct all possible parse (binary) trees and check if any of them is a valid parse tree for w

- Let |w| = n. Since G is in Chomsky Normal Form, w has a parse tree of size 2n − 1 iff w ∈ L(G)
- Construct all possible parse (binary) trees and check if any of them is a valid parse tree for w
- ► Number of parse trees of size 2n 1 is k²ⁿ⁻¹ where k is the number of variables in G. So algorithm is exponential in n!
